***Fixating and following Torch Light (TL) and gradually improved vision as days passed.***

***Vandana Gupta is a 4 year old child with congenital bilateral cataract and squint in both the eyes. Her family history reveals that it occurs in hereditary and her siblings were also suffering from this disease. Unfortunately, Vandana could not see anything but light sometimes. This was irony with her because she was entirely dependent on her parents and became an irritable child due to her blindness. Her parents were financially weak and could not afford money for the surgery.***

*Fortunately, one day Vandana's father got to know about Sadguru Netra Chikitsalaya and its free eye care services and brought her child along with one of his relative, who was also suffering from this troublesome cataract since birth. Here in the Hospital they went for the consultation with the doctor's and were suggested for the surgery in the right eye first. (Later on her left eye would be undergone for surgery after a month). The surgery was done and now she's able to perceive the light and fixating the object nearby. Gradually her vision was improved day by day as she would grow up. Her father was quite satisfied with the surgery outcome and got a ray of hope for his daughter's vision because he knew, his daughter has the whole life and tremendous circumstances lies ahead. He was quite willing to visit SNC once again to have the surgery on the vandana's left eye.*
